# THE NEXT GENERATION IN VARIETY EVALUATION.

Canola Performance Trials (CPT) represent the next generation in variety evaluation for Western Canadian canola growers. The trials provide:

- Relevant, unbiased and timely performance data that reflects actual production practices.
- Comparative data on leading varieties and newly introduced varieties.

The CPT system includes both small plot and large field scale trials. Results for 2014 are based on 25 small plot trials and 101 field scale trials across the Prairies. Further information and variety evaluation tools are available online at [www.canolaperformancetrials.ca](http://www.canolaperformancetrials.ca).

Field scale comparisons add extra perspective for assessing consistency in variety performance. For field scale plots, two or more varieties were compared at each site, and each site had a common check, 73-75 RR. Comparisons are based on harvested strips of 0.5 to 1.5 acres each. Field scale data is not necessarily replicated in all cases, but the data presented has been audited to make sure it complies with CPT protocols.

The CPT technical committee established protocols and developed research plot designs to ensure that the data is representative. Performance objectives were established to provide guidelines on timely field operations and data collection.

Site distribution is based on seeded acres in Manitoba, Saskatchewan, Alberta and British Columbia.

The small plot system ensures that:

- All varieties are treated with appropriate commercially associated herbicides and seed treatments.
- An independent third party representative inspects all trials.
- Varieties are in blocks based on maturity. That way, harvest occurs at the appropriate time to minimize harvest losses due to maturity differences.

All sites are inspected to verify these guidelines were followed to allow a fair comparison among the varieties tested.

Audits of field scale projects give growers the confidence that the protocol was conducted in a scientifically sound manner and that comparisons are appropriate. Qualified professionals with extensive background in conducting field scale research trials perform the audits.

This booklet is one of several sources of information to consider in making the best decisions for your farm.

# PROGRAM MANAGEMENT

The three Prairie canola grower groups – Alberta Canola Producers Commission, the Saskatchewan Canola Development Commission (SaskCanola) and the Manitoba Canola Growers Association – fund the program. The Canola Council of Canada delivers the program.

Seed trade companies that participate pay entry fees. The B.C. Grain Producers Association is conducting trials in the Peace region as its means of participation.

Haplotech (led by Dr. Rale Gjuric) coordinates the trials under the guidance of a governance committee that oversees approval of varieties, protocol design, data collection, analysis and reporting, and financial management. Governance committee members include representatives from the provincial grower groups including B.C.; provincial oilseed specialists from Manitoba, Saskatchewan and Alberta; three commercial Canadian Seed Trade Association representatives; and the Canola Council of Canada (CCC). The CCC delivers the program on their behalf.

For 2014, participants in the trials consist of line companies, independent retailers and seed companies including Bayer CropScience, BrettYoung Seeds, CANTERRA SEEDS, Cargill, DL Seeds, Monsanto, Syngenta and Proven Seed/ Crop Production Services.

# USING THE TABLES

Results are organized by short, medium and long season zones. CPT uses the Western Canada Canola/Rapeseed Recommending Committee (WCC/RRC) season zones, which are based on typical frost free days, growing degree days and soil type. Grey wooded soils, for example, are in the short season zone. See Table A for specific numbers for each zone.

Table A: Season Zones		
Season	Frost Free Days	Growing Degree Days (Base 5°C)*
Short	75–95	1,100–1,450
Medium	95–115	1,450–1,700
Long	115+	1,700+

\*On a base 5°C scale, growing degree days only accumulate on days when highs are above 5°C.

Small plot and field scale data are presented separately in the following tables. For more detailed performance results, growing conditions and production details for specific trial sites, use the online CPT database at [www.canolaperformancetrials.ca](http://www.canolaperformancetrials.ca).

The tables include yield, days to maturity, height and lodging scores for each variety. Lodging scores are between 1 and 5, with 1 being no lodging and 5 being completely lodged.

Gross revenue is based on yield multiplied by \$9.28/bu. This is based on \$409.30 per tonne, the March 2015 futures close on October 1, 2014 and a 50-pound bushel weight. Premiums are included in the calculations for specialty market varieties.

In the tables, varieties are listed numerically and alphabetically, starting with Clearfield (CL) varieties, followed by Liberty Link (LL) and Roundup Ready (RR).

Each zone and small plot location is identified on the map on page 5.

1. To begin, use the map on page 5. Identify your growing season zone and trial locations closest to your farm.
2. To evaluate yield potential, look at all small plot and field scale locations in your growing season zone and the average yield for your zone.
3. Consider other information such as maturity, lodging resistance and cost.
4. Ask your seed dealer for more information on specific varieties.

# TOOLS TO HELP YOU MAKE BETTER CHOICES

**CV** – For coefficient of variation (CV), the lower the CV value, the more reliable the test. For example, if comparing results from two test locations, one with a CV of 4% and the other with a CV of 8%, the test with the CV of 4% can be considered more reliable. There is always variability in research trials. The key is designing and managing experiments so CVs stay within a reasonable range. For the CPT, experience has shown that CVs below 15% indicate good test reliability.

**LSD** – The least significant difference (LSD at a 5% level of statistical significance) for each dataset indicates whether differences between varieties are statistically meaningful. Varieties should only be considered different in yield performance if the

numerical difference between them is greater than the LSD value. Using the sample table below, if the LSD is 5.0, varieties A and B are not statistically different, B and C are not statistically different, but A and C are statistically different. In the yield graphs for each season zone (see page 7), LSD for each variety group is given on the left.

Variety	Yield (bu./ac.)
A	52
B	54
C	58
LSD	5.0

\*Gross revenue for this Cargill Specialty Canola hybrid includes a premium of \$1.13/bu. Yield is rounded to the nearest whole number. Gross revenue is based on non-rounded yield. Gross revenue is yield multiplied by \$11.20/bu. VR 9560 CL is eligible for pricing premiums of \$15/MT (Alberta), \$25/MT (Saskatchewan) and \$35/MT (Manitoba) in addition to the price provided in the "Gross Revenues" column. Final premium amount will be dependent on delivery period. Contact Viterra for more details. SY4157, sponsored by Syngenta, was previously named 09H7757 and sponsored by Cargill in 2013.

\*Gross revenue for this Cargill Specialty Canola hybrid includes a premium of \$1.13/bu. Yield is rounded to the nearest whole number. Gross revenue is based on non-rounded yield. Gross revenue is yield multiplied by \$11.20/bu. VR 9560 CL is eligible for pricing premiums of \$15/MT (Alberta), \$25/MT (Saskatchewan) and \$35/MT (Manitoba) in addition to the price provided in the "Gross Revenues" column. Final premium amount will be dependent on delivery period. Contact Viterra for more details. SY4157, sponsored by Syngenta, was previously named 09H7757 and sponsored by Cargill in 2013.

\*Gross revenue for this Cargill Specialty Canola hybrid includes a premium of \$1.13/bu. Yield is rounded to the nearest whole number. Gross revenue is based on non-rounded yield. Gross revenue is yield multiplied by \$11.20/bu. VR 9560 CL is eligible for pricing premiums of \$15/MT (Alberta), \$25/MT (Saskatchewan) and \$35/MT (Manitoba) in addition to the price provided in the "Gross Revenues" column. Final premium amount will be dependent on delivery period. Contact Viterra for more details. SY4157, sponsored by Syngenta, was previously named 09H7757 and sponsored by Cargill in 2013.

# CANOLA PERFORMANCE TRIALS 2014 RESULTS

## Field Scale Trial Yield Results

Field scale trials are managed by growers using their typical production practices. Trials are planted, swathed, harvested and, when necessary, sprayed by growers using the respective herbicide systems according to established protocols. Individual plots range from 0.5 to 1.5 acres. Results below are given as a percentage of the check, 73-75 RR. Yield in bu./ac. for 73-75 RR for each location is given in brackets at the end of each row.

Location	2014 Yield Results (% of check, 73-75 RR)

\*Denotes 5% level of statistical significance using paired t-tests. Note that the paired t-tests in large scale tables only compare individual varieties to the check variety 73-75 and not to each other.

When comparing average results between varieties, consider the number of test sites for each variety. Field scale trials occasionally produce data that is above or below the expected range. If agronomic observations cannot explain these outliers, then they are checked against the statistical limits of deviation established by the Canola Performance Trials technical committee. If the data falls outside the limits, it is removed. For more details on individual trials and for data from sites that reported after this booklet went to print, visit [www.canolaperformancetrials.ca](http://www.canolaperformancetrials.ca).
