SEEDING
DECISIONS.

Brought to you by:

THE NEXT GENERATION IN VARIETY EVALUATION.

Canola Performance Trials (CPT) represent the next generation in variety evaluation for Western Canadian canola growers. The trials provide:

- Relevant, unbiased and timely performance data that reflects actual production practices.
- Comparative data on leading varieties and newly introduced varieties.

The new CPT system includes both small plot and large field scale trials. Results for 2011 are based on 23 small plot trials and 108 field scale trials across the Prairies.

Field scale comparisons add extra perspective for assessing consistency in variety performance. For field scale plots, two or more varieties were compared at each site. Comparisons are based on harvested strips of 0.5 to 1.5 acres each. Field scale data is not necessarily replicated in all cases, but the data presented has been audited to make sure it complies with CPT protocols.

The CPT technical committee established protocols and developed research plot designs to ensure that the data is representative. Performance objectives were established to provide guidelines on timely field operations and data collection.

Site distribution is based on seeded acres in Manitoba, Saskatchewan, Alberta and British Columbia.

The small plot system ensures that:

- All varieties are treated with appropriate commercially associated herbicides and seed treatments.
- An independent third party representative inspects all trials.
- Varieties are harvested at the appropriate time to minimize harvest losses due to maturity differences.

All sites are inspected to verify these guidelines were followed to allow a fair comparison among the varieties tested.

Audits of field scale trials give growers the confidence that the protocol was conducted in a scientifically sound manner and that comparisons are appropriate. Qualified professionals with extensive background in conducting field scale research trials perform the audits.

This booklet is one of several sources of information to consider in making the best decisions for your farm.

PROGRAM MANAGEMENT

The three Prairie canola grower groups – Alberta Canola Producers Commission, the Saskatchewan Canola Development Commission (SaskCanola) and the Manitoba Canola Growers Association – fund the program.

Seed trade companies that participate pay entry fees. The B.C. Grain Producers Association is conducting trials in the Peace as their means of participation.

HaploTech (led by Dr. Rale Gjuric) coordinates the trials under the guidance of a governance committee which oversees approval of varieties, protocol design, data collection, analysis and reporting, and financial management. Governance committee members include representatives from the provincial grower groups including B.C.; provincial oilseed specialists from Manitoba, Saskatchewan and Alberta; three commercial Canadian Seed Trade Association representatives; and the Canola Council of Canada (CCC). The CCC delivers the program on their behalf.

Participants in the small plot trials consist of line companies, independent retailers and seed companies including Viterra, Bayer CropScience, Monsanto, Dow AgroSciences, Cargill, Canterra Seeds, BrettYoung Seeds, FP Genetics and SeCan. For 2011, Monsanto, Bayer CropScience, Canterra Seeds and Dow AgroSciences are also participating in the field scale component of the program.

USING THE TABLES

Results are organized by short, medium and long season zones. CPT uses the Western Canada Canola/Rapeseed Recommending Committee (WCC/RRC) season zones, which are based on typical frost free days, growing degree days and soil type. Grey wooded soils, for example, are in the short season zone. See Table A for specific numbers for each zone.

Table A: Season Zones		
Season	Frost Free Days	Growing Degree Days (Base 5°C)*
Short	75–95	1,100–1,450
Medium	95–115	1,450–1,700
Long	115+	1,700+

*On a base 5°C scale, growing degree days only accumulate on days when highs are above 5°C.

Small plot and field scale data are presented separately in the following tables. For more detailed performance results, growing conditions and production details for specific trial sites, use the online CPT database at www.canolaperformancetrials.ca.

The tables include yield, days to maturity, height and lodging scores for each variety. Lodging scores are between 1 and 5, with 1 being no lodging and 5 being completely lodged.

Gross revenue is based on yield multiplied by \$11.87/bu., the average March 2012 delivery price. Premiums are included in the calculations for specialty market varieties. Calculations are based on premiums available on Dec. 1, 2011. They are subject to change.

In the tables, varieties are listed numerically and alphabetically, starting with Clearfield (CL) varieties, followed by Liberty Link (LL) and Roundup Ready (RR).

Each zone and small plot location is identified on the map to the right.

1. To begin, use the map on the right to identify your growing season zone and trial locations closest to your farm.
2. To evaluate yield potential, look at all small plot and field scale locations in your growing season zone and the average yield for your zone.
3. Consider other information such as maturity, lodging resistance, and cost. The online database at www.canolaperformancetrials.ca includes an Economic Calculator.
4. Ask your seed dealer for more information on specific varieties.

TOOLS TO HELP YOU MAKE BETTER CHOICES

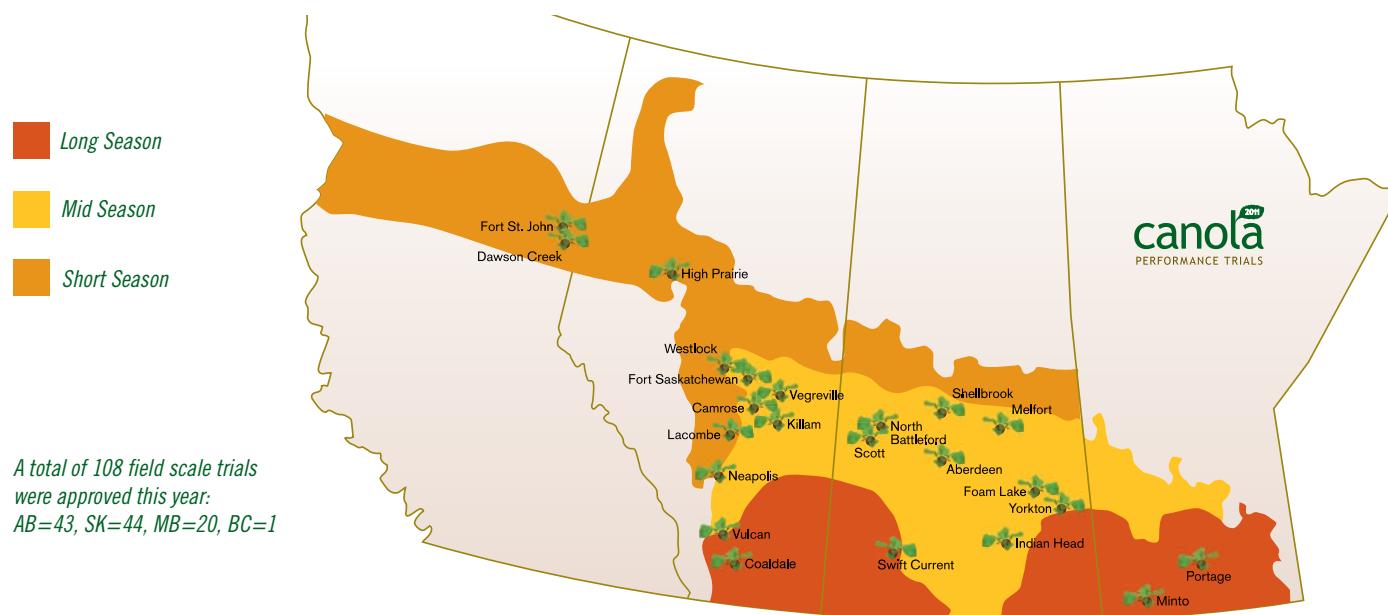

CV – For coefficient of variation (CV), the lower the CV value, the more reliable the test. For example, if comparing results from two test locations, one with a CV of 4% and the other with a CV of 8%, the test with the CV of 4% can be considered more reliable. There is always variability in research trials. The key is designing and managing experiments so CVs stay within a reasonable range. For the CPT, experience has shown that CVs below 15% indicate good test reliability.

LSD – The least significant difference (LSD) for each dataset indicates whether differences between varieties are statistically meaningful. For example, if the LSD is 5.0, varieties should only be considered different in yield performance if the numerical difference between them is greater than the LSD value. Using the sample table

below, if the LSD is 5.0, varieties A and B are not statistically different but varieties A and C are statistically different. In the yield graphs for each season zone, the extra lines at the top of each bar indicate the LSD. Varieties with lines that overlap are not statistically different for that zone.

*Indicates premium. For program details, see www.canolaperformancetrials.ca. **Indicates interim registration only. ***Experimental line.

Yields are rounded to the nearest whole number for this table. Gross revenue is based on non-rounded yield.

CANOLA PERFORMANCE TRIALS 2011 RESULTS

Field Scale Trial Yield Results

Field scale trials are managed by growers using their typical production practices. Not all varieties from the small plot trials were tested in field scale trials. Individual plots range from 0.5 to 1.5 acres in size. Trials are planted, swathed, harvested, and, when necessary, sprayed by growers using the respective herbicide systems according to established protocols. For more details on individual trials visit www.canolaperformancetrials.ca.
